Hi Britte and Emily,

After reevaluating 30 randomly selected surveys from wave 7 data collection, I calculated an error rate of 2.4% for the sample. There were a total of 6 surveys that had errors. I noticed survey qd4373 from unit BD had an unusual number of errors. More than half of the responses were entered incorrectly. After looking into this, we found that two surveys had been filled out under the same ID. Because of this, we have removed this ID from the sample. Without including this outlier of a survey, the error rate can be calculated to a more reasonable 0.26%. There does not appear to be any consistent issues with the sampled surveys, all mistakes seem to be random mistypes.

Best,
Brooke
